FIRE DAMPER FDMQ

The **FDMA-PM** fire damper has changed its trade name and is still manufactured under the trade name **FDMQ**.

These technical specifications state a row of manufactured sizes and models of fire dampers (further only dampers) FDMQ. It is valid for production, designing, ordering, delivery, assembly and operation.

II. GENERAL INFORMATION

1. Description

- 1.1.** Fire dampers are shutters in ducts of air-conditioning devices that prevent spreading the fire and combustion products from one fire segment to the other one by means of closing the duct in the points of fire separating constructions.

Dampers blade automatically closes air duct using a shutting spring or an actuating mechanism back spring. The shutting spring is started by releasing an initiation lever. The impulse for releasing the lever can be either a manual one, a thermal one. The back spring of the actuating mechanism is started when the thermoelectrical starting mechanism BAT is activated, when a reset button on BAT is pushed or when a power supply of the actuating mechanism is stopped. The damper is sealed with a silicon packing against smoke penetration after closing the blade. At the same time, the damper blade is bedded in a material which enlarges its capacity and air proofs the air duct.

Dampers have two inspection holes.

Fig. 1 FDMQ with actuating mechanism

Fig. 2 FDMQ with mechanical control

- 1.2.** Damper characteristics

- CE certified acc. to EN 15650
- Tested in accordance with EN 1366-2
- Classified acc. to EN 13501-3+A1
- Fire resistance EIS 120, EIS 90
- External Casing leakage class C, Internal leakage class 2 acc. to EN 1751
- Cycling test in class C 10 000 acc. to EN 15650
- Corrosion resistant acc. to EN 15650
- ES Certificate of conformity No. 1391-CPR-2020/0003
- Declaration of Performance No. PM/FDMQ/01/20/1
- Hygienic assessment of fire dampers - Report No. 1.6/pos/19/19b

- 1.3.** Working conditions

Right damper function is secured under the following conditions:

- a) Maximum air circulation speed: 12 m/s
Maximum pressure difference: 1200 Pa
- b) The air circulation in the whole damper section must be secured as steady on whole surface.

Operation of the dampers does not depend on the direction of air circulation. The dampers can be located in an arbitrary position.

Dampers are suitable for systems without abrasive, chemical and adhesive particles.

Dampers are designed for macroclimatic areas with mild climate according to EN 60 721-3-3.

Temperature in the place of installation is permitted to range from -30°C to +50°C.

2. Design

2.1. Design with mechanical control

Design .01

Design with mechanical control with a thermal protective fuse which actuates the shutting device, after the nominal start temperature 72°C has been reached. Automatic initiation of the shutting device is not activated if the temperature does not exceed 70°C. In case that other start temperatures are required, thermal fuses with nominal start temperature +104°C or +147°C can be supplied (this requirement must be specified in the order).

Fig. 3 Design .01

ATTENTION:

Mechanisms are produced in five designs **M1** to **M5**, difference is only in size of inner spring, which closes the fire damper. For the size of fire dampers is always assigned the size of mechanism - **Tab 4.2.1**. It is not recommended to use different size of mechanism, than given by the manufacturer, otherwise, there is a risk of fire damper destruction.

Design .11

Design .01 with mechanical control can be complemented with a limit switch signalling of the damper blade position "CLOSED". Cable is connected directly to limit switch.

Fig. 4 Design .11

Design .80

Design .01 with mechanical control can be complemented with a terminal switches signaling of the damper blade position "CLOSED" and "OPEN". Limit switches are connected via damper casing, cables are connected directly to limit switches.

Fig. 5 Design .80

Fig. 6 Limit switch G905-300E03W1

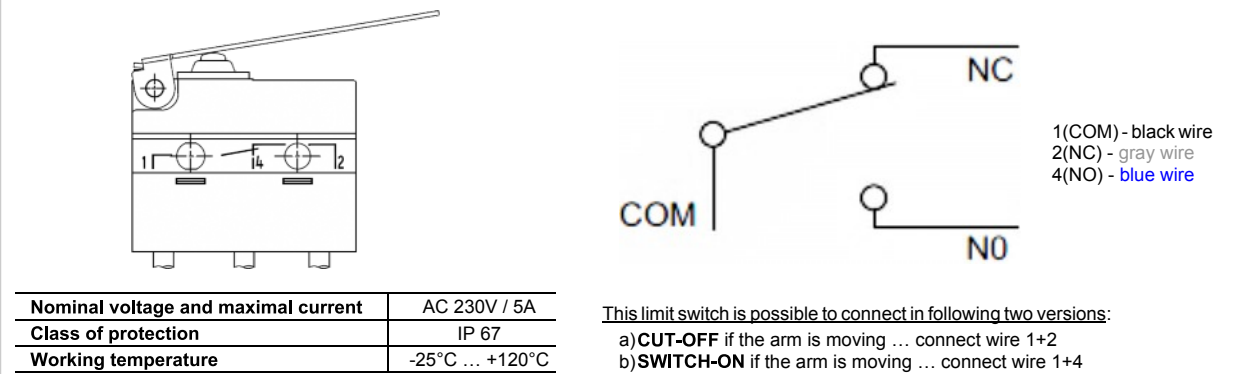

Fig. 7 Change of mechanical design for the motorised one or vice versa

2.2. Design with actuating mechanism

Design .40, .50

FDMQis always equipped by electric actuating mechanism BFL, BFN, BF 230-TN or BFL, BFN, BF 230-TN (further only "actuating mechanism"). After being connected to power supply AC/DC 24V or 230V, the actuating mechanism displaces the damper blade into operation position "OPEN" and at the same time it pre-stretches its back spring. When the actuating mechanism is under voltage, the damper blade is in the position "OPEN" and the back spring is pre-stretched. Time needed for full opening of the flap blade from the position "CLOSED" to the position "OPEN" is maximum 120 sec. If the actuating power supply is cut off (due to loss of supply voltage, or pushing the reset button on the thermoelectrical starting mechanism BAT), the back spring displaces the damper blade into the breakdown position "CLOSED". The time of displacing the blade from the position "OPEN" to the position "CLOSED" takes maximum 20 sec. In case that the power supply is restored again (the blade can be in any position), the actuating mechanism starts to re-displace the damper blade into the position "OPEN".

A thermoelectrical starting mechanism BAT, which contains two thermal fuses Tf1 and Tf2, is a part of the actuating mechanism. These fuses are activated when temperature +72°C has been exceeded (the fuse Tf1 when the temperature around the damper and the fuses Tf2 when the temperature inside the air-conditioning piping has been exceeded). After the thermal fuse Tf1 or Tf2 has been activated, the power supply is permanently and irreversibly cut off and the actuating mechanism, by means of the pre-stretched spring, displaces the damper blade into the breakdown position "CLOSED".

Signalisation of damper blade position "OPEN" a "CLOSE" is provided by two limit switches.

Design .41, .51

Design .41 or .51 with actuating mechanism can be complemented with smoke detector ORS 142 K. The voltage can be AC 230 V or 24 V DC. Design with voltage AC 230 V is equipped with Communication and supply device BKN 230-24-MOD and with actuating mechanism BF 24-TN (BFL 24-T, BFN 24-T).

The smoke detector is activated when smoke spreads in air duct system. Deactivation of smoke detector is provided by interruption of supply voltage for min. 2s.

Signalisation of damper blade position "OPEN" a "CLOSE" is provided by two limit switches..

Tab. 2.2.3. Optical smoke detector ORS 142 K with the socket 143A

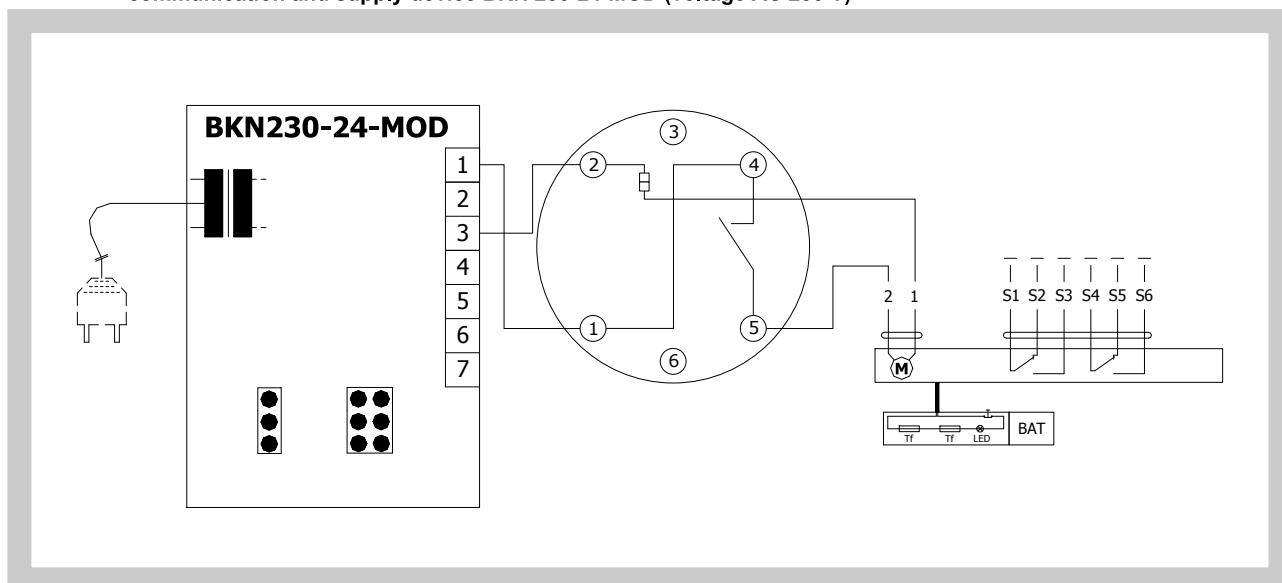

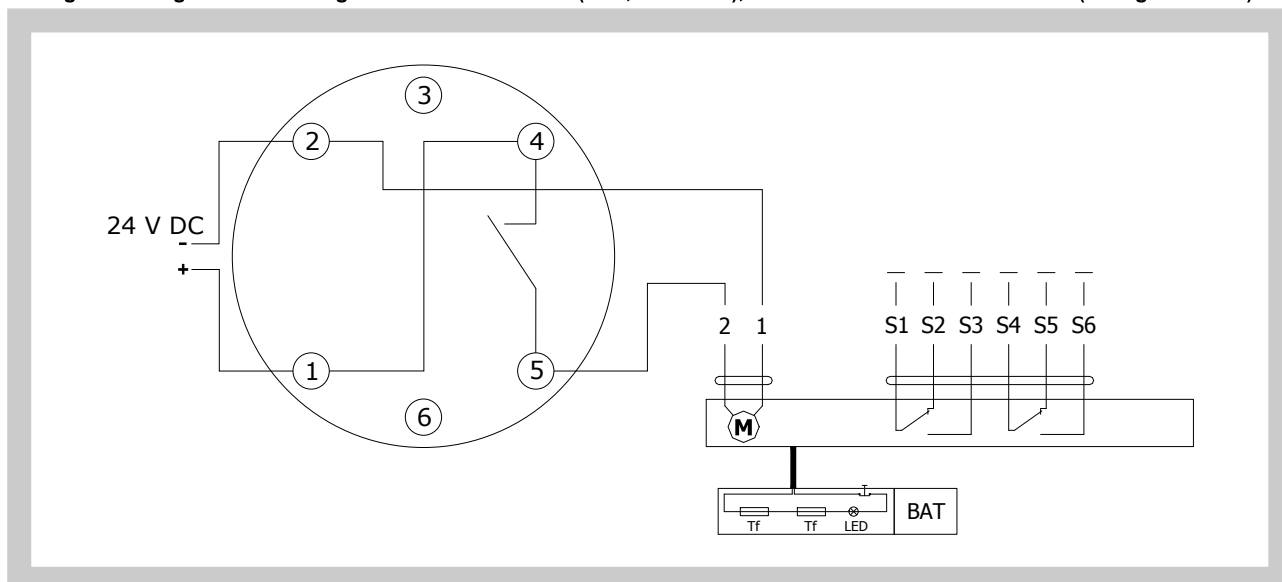

Fig. 14 Design with actuating mechanism BF 24-TN (BFL, BFN 24-T), with smoke detector ORS 142 K (voltage 24 V DC)

2.3. Design with the communication and supply device

Design .60

Design with the communication and supply device BKN 230-24 and the actuating mechanism BF 24-TN-ST (BFL 24-T, BFN 24-T). It simplifies electrical wiring and interconnection of fire flap valves. It facilitates on site check and enables central control and checks of fire damper by means of a simple 2-conductor wiring.

BKN 230-24 functions as a decentralized network device for supplying the actuating mechanism BF 24-TN-ST (BFL 24-T, BFN 24-T) with a spring back drive on one hand and on the other hand it transmits the signal informing about the flap valve position OPERATION and FAILURE through 2-conductor wiring to the central. Control command SWITCHED ON - SWITCHED OFF from the central through BKN 230-24 goes through the same wiring to the actuating mechanism.

To simplify the connection, the actuating mechanism BF 24-TN-ST (BFL 24-T, BFN 24-T) is equipped with connecting plugs that are inserted directly to BKN 230-24. BKN 230-24 is supplied with a conductor and an EURO plug to be connected to the 230V mains. 2- conductor wiring is connected to BKN 230-24 by means of terminals 6 and 7. If the drive is supposed to be controlled without any signal from the central, it can be switched on by means of a bridge between the terminals 3 and 4. A green LED pilot light on BKN 230-24 is on when voltage is present in the drive (AC 24V).

If the button on BAT is switched on or if the power supply (e.g. by a signal from ELECTRICAL FIRE SIGNALISATION) is disconnected, the damper position will be "FAILURE".

Fig. 15 Design with the communication and supply device BKN 230-24, BKN230-24-C-MP or BKN 230-24-MOD

Tab. 2.3.1. Communication and supply device BKN 230-24

Communication and supply device	BKN 230-24

Fig. 16 Communication and supply device BKN 230-24, with act. mechanism BF 24-TN-ST (BFL 24-T-ST, BFN 24-T-ST)

**Design .61**

Design .61 with communication and supply device can be complemented with smoke detector ORS 142 K. For supply and communication is used BKN 230-24-C-MP, which together with the BF 24TN-ST (BFL 24T-ST, BFN 24T-ST) enables central control and checks of fire damper by means of a simple 2-conductor wiring and it also allows connection to the system via MP-BUS communication. More information in the Belimo catalog.

Design .63

Design .60 with communication and supply device can be complemented with smoke detector ORS 142 K. For supply and communication is used BKN 230-24-MOD, which is used together with the BF 24TN-ST (BFL 24T-ST, BFN 24T-ST) for communication with control systems using the Modbus RTU or BACnet MS / TP protocol. The wiring of the line is to be carried out in accordance with applicable RS485 regulations. Parameterization of the communication is done using DIL switches. The BKN 230-24-MOD can be installed separately, without a connection to a master control system, in which case the connection bridge between the terminals 1 and 4 must be installed. For more information, see the Belimo catalog.

**Design .62**

Design with the communication and supply device BKN 230-24MP and actuating mechanism BF 24TL-TN-ST for connection to MP-Bus. BKN 230-24MP supplies to intelligent actuating mechanisms of fire dampers BF 24TL-TN-ST decentrally needed power supply. In this way can be realize long MP-Bus communications (up to 800 m). Up to 8 Bus nodes can be parallel connected and controlled by Master device (DDC with interface). More information in Belimo catalogue.

Design .64

Design with the communication and supply device BKN 230-24LON and actuating mechanisms of fire dampers BF 24TL-TN-ST for cooperation with control units based on technology LonWorks. BKN 230-24LON complements actuating mechanism for integrated safety function and converts digital protocol MP from actuating mechanism to LonTalk and back. More information in Belimo catalogue.

3. Communication and control devices

- 3.1.** BKS 24-1B communication and control device is used for control and checks of fire dampers with the BF 24-TN-ST (BFL 24-T-ST, BFN 24-T-ST) actuating mechanism in conjunction with the BKN 230-24 supply and communication device. BKS 24-1B receives information about the situation of the fire damper through the BKN 230-24 supply and communication device and issues controlling commands. The device is intended for building in into the distribution board. Light diodes on the front side of the device signalise the operating situations of the damper and breakdowns of the whole system. Potentialless auxiliary contacts enable connection to the master control system (signaling of the damper position, failure reports, release of the ventilators etc.). While a flashing green LED pilot light signalises damper blade motion towards the given position, the same pilot light reports reaching the required position when shining constantly. If the flap blade, with respect to the given time, does not reach the required position, then a red LED pilot light starts to flash and at the same time, the failure contact is active. Once the damper blade reaches the given position, this contact is deactivated. The LED pilot light keeps flashing unless the failure is unblocked by means of the RESET button. Except for reporting failures, other three auxiliary contacts are available. Contacts showing operating and failure position of the damper are active when the damper is in the given position. Function check can be done by pressing and holding the button "RESET/TEST" for longer time. While holding the button, the damper blade moves in the direction of the failure position. Fault function is indicated by the LED pilot light. BKS 24-1B can be connected by means of ZSO-11 11 pole connector for DIN 35 mm panel.

Fig. 24 Communication and control device BKS 24-1B

Tab. 3.1.1. Communication and control device BKS 24-1B

Communication and control device	BKS 24-1B
Nominal voltage	AC 24 V 50/60Hz
Power consumption	2,5 W (operating position)
Dimensioning	5 VA
Protection Class	III
Degree of protection	IP 30
Ambient temperature	0 ... +50°C
Connection	11-pole connector ZSO-11, it is not part of BKS24-1B, ZSO-11 is 11-pole screw terminal 11 x 1,5 mm ²

- 3.2.** BKS 24-9A communication and control device is used for group control and checks of 1 to 9 fire dampers with the actuating mechanism BF 24-TN-ST (BFL 24-T-ST, BFN 24-T-ST) in connection with the supply and communication device BKN 230-24. Signalisation of the damper position is individual; the damper can be controlled and tested only as a group. BKS 24-9A is intended for use in the distribution board and displays the operation situations and failure reports of the connected fire dampers. It is possible to signalise functions such as the damper position and failure reports or to transmit them further to the system by means of integrated auxiliary switches. BKS 24-9A receives signals from BKN 230-24 through the two-conductor wiring and issues control commands. Proper damper operation is indicated by two light LED diodes:

Control ON = position OPERATION
Control OFF = position FAILURE

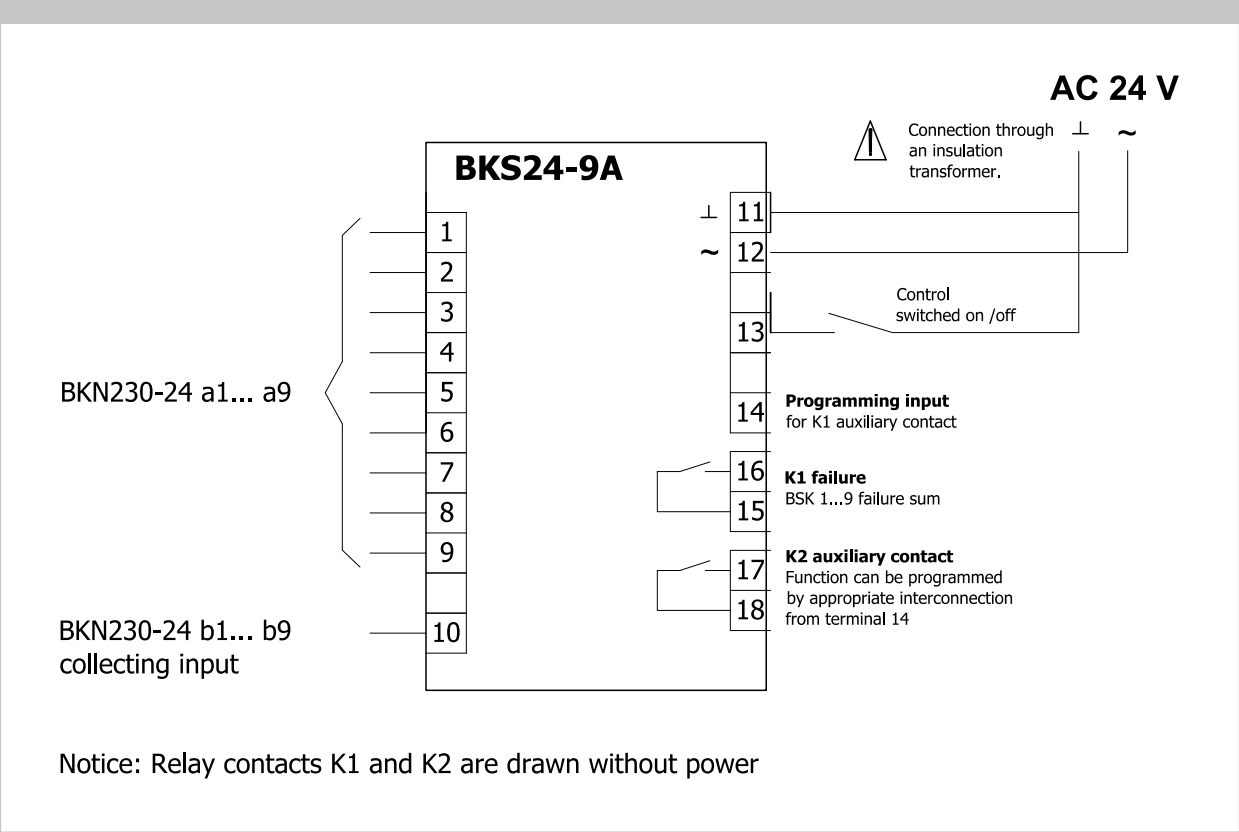

If the fire damper do not reach the given position in time tolerable for displacing, the appropriate light diode FAILURE starts to flash and K1 contact is opened (current failure). In case that the faulty damper finally reaches its given position, K1 is closed and the failure report light shines (the failure is saved in memory). K2 - the auxiliary contact - is used for signaling of the flap position to the master device. Function of this auxiliary contact can be programmed through the terminal 14 according to the Tab. 3.2.1.

Tab. 3.2.1. BKS 24 -9A contacts K1 and K2

Function contact K1		Programming K2 Auxiliary Contact		
situation	state	function	interconnection	state
current failure	15  16	K2 contact is on if all the flaps are open	14  11	17  18
		K2 contact is on if the flap No. 1 is open	14  12	
no failure	15  16	K2 contact is on if all the flaps are closed	14 open	

Function check can be done in the position OPERATION by means of pushing the TEST button. While the button is pushed, the flap blade is turning into the position FAILURE. Fault function is indicated by a report "FAILURE". Assembly and connection BKS 24 - 9A can be made by DIN 35 mm panel. It is connected by two 9-pole plug-in connectors.

4.3. Blades overlaps

Tab. 4.3.1 Blades overlaps

Blades overlaps		Dimension	Overlaps
DAMPER OVERLAPS Fig. 28	Act. mechanism side	"a"	Tab. 4.2.1
	Side without act. mechanism	"c"	Tab. 4.2.1

These values has to be respected when projecting related air-conditioning ducts.

Fig. 28 Damper overlaps

- 4.4. For the design .60 (with BKN supply and communication device) add to weight of the damper with an actuating mechanism (Tab. 4.2.1.) the weight of BKN (0.5 kg).
- 4.5. Dampers can be supplied on the customer’s demands in all subdimension of the above mentioned range.
- 4.6. Flanges of rectangular fire dampers are 30 mm wide with oval hole

Fig. 29 Flange of Damper - OPERATORS SIDE

Fig. 30 Flange of Damper - INSTALLATIONS SIDE

5. Placement and Assembly

- 5.1.** The fire dampers are suitable for installation in arbitrary position in vertical and horizontal passages of fire separating structures. The damper assembly procedures must be done so that all load transfer from the fire separating constructions to the damper body is absolutely excluded. The back-to-back air-conditioning piping must be suspended or supported so that all load transfer from the back-to-back piping to the damper flanges is absolutely excluded. The gap between the installed damper and the building structure must be perfectly filled with approved material all over its volume.

To provide the necessary space for access to the control device, all other items must be situated at least 350 mm from the control parts of the damper. At least one inspection hole must be accessible.

The damper must be installed so that the damper blade (in closed position) is situated in the fire separating structure - marked by the label BUILD-IN EDGE on the damper body. If such solution is not possible, the piping between the fire separating structure and the damper blade must be protected according to the certified installation method, see [Section 6](#).

During the installation and plastering process, the control mechanism must be protected (covered) against damage and pollution. The damper body should not be deformed during bricking in. Once the damper is built in, the damper blade should not grind on the damper body during opening or closing.

The distance between the fire damper and the structure (wall, ceiling) must be 75 mm at the minimum. If two or more dampers are to be installed in one fire separating structure, the distance between adjacent dampers must be 200 mm at the minimum, according to EN 1366-2 paragraph 13.5. For admissible exceptions see [Section 6](#).

Fig. 31 The distance between the fire damper and the construction

Fig. 32 Built in edge

"Wall edge sticker" indicates the recommended edge of installation of fire damper into the fire partition structure (wall). The damper must be installed so that the entire damper blade - in the closed position - is located inside the fire separating structure (wall) and at the same time the control mechanism and inspection openings are freely accessible.

5.2. Installation opening dimensions

Fig. 33 Installation opening dimensions

5.3. Examples of fire damper installing

The fire damper can be integrated into a solid wall construction made e.g. of normal concrete/ masonry, porous concrete with minimum thickness 100 mm or into solid ceiling construction made e.g. of normal concrete with minimum thickness 110 mm or porous concrete with minimum thickness 125 mm.

The fire damper can be integrated into a gypsum wall construction with fire classification EI120 or EI 90.

The fire damper can also be integrated outside the wall construction. Duct and the damper part between the wall construction and the damper blade (labelled with BUILD IN EDGE on the protective covering) must be protected with fire-fighting insulation.

If is damper installed outside a construction it is necessary to use reinforcement VRM for dampers with dimension $A \geq 800$ mm.

6 Statement of installations

6.1. Installation method list

Tab. 6.1.1. Installation method list

Fire separating constru.	Wall/Ceiling	Installation	Fire resist.	Page

6.2. Installation in solid wall construction

Fig. 34 Solid wall construction - mortar or gypsum

Fig. 35 Solid wall construction - fire protection foam with stucco plaster

Fig. 36 Solid wall construction - battery - mortar or gypsum

EIS 90

**Notice:**

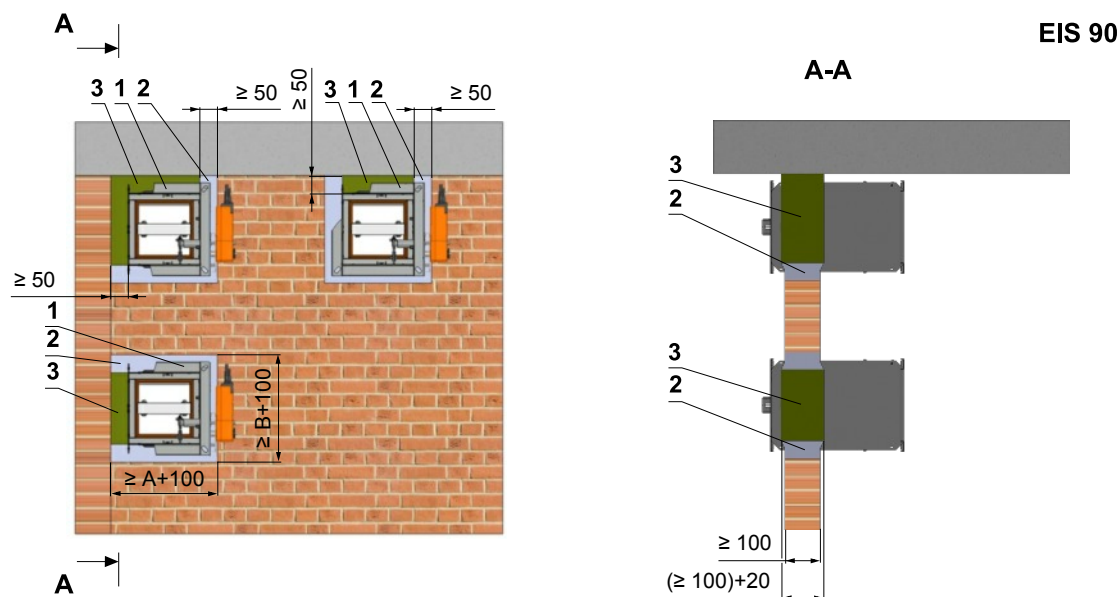

- Installation opening for each damper has minimal dimensions $a \times b = (A+100) \times (2 \times B + 100)$ mm or $(2 \times A + 100) \times (B + 100)$ mm
- Gap between damper and construction is filled by mortar or gypsum
- Distance between dampers 60 mm
- Flange to flange connection - Up to four dampers can be installed

Position:

- 1 Fire damper
- 2 Solid wall construction
- 3 Mortar or gypsum

Shown schemes of incorporation and damper are illustrative only !

Fig. 37 Solid wall construction - installation next to wall - mortar or gypsum and mineral wool

Position:

- 1 Fire damper
- 2 Mortar or gypsum
- 3 Stuffing box (mineral stone wool min. density 140 kg/m^3)

Notice:

- Gap between damper and construction is filled by mortar or gypsum and mineral wool
- Wool is fixed to damper body and construction by fire protection mastic.
- Mineral wool thickness = construction thickness + 20 mm or 50 mm
- Installation is valid for ceiling construction

Shown schemes of incorporation and damper are illustrative only !

Fig. 38 Solid wall construction - stuffing box, fire protection mastic and cement lime plate

Screws has to be fixed in wall/ceiling construction.
(If it is needed use steel bracket).

Used materials - example:**

Position:

- 1 Fire damper
- 2 Solid wall construction
- 3 Stuffing box (mineral stone wool min. density 140 kg/m³)
- 4 Fire protection mastic min. thickness 1 mm
- 5 Cement lime plate min. thickness 15 mm min. density 870 kg/m³
- 6 Duct

- 3 Promapyr, Rockwool Steprock HD, Hilti CFS-CT B 1S 140/50
- 4 Promastop - P, K, Hilti CFS-CT
- 5 Promatect - H

** Fire resistant insulation and fire resistant board can be replaced by another approved fire sealing system for damper installation with equivalent material properties.

The damper must be anchored to the fire wall construction !
Shown schemes of incorporation and damper are illustrative only !

7. Thin shaft wall

Thin shaft wall description

Shaft wall is a vertical, non-bearing partition construction meeting the double-sided fire requirements. The shaft wall can be mounted only from one side. No mineral insulation is used in the construction.

First of all, the shaft wall structure must be laid out. Apart from other vertical constructions, the perimeter sections must be fitted with connection sealing made from A1 or A2 fire reaction materials (for instance floor strips Orsil N/PP). The perimeter sections must be anchored using steel plugs Ø 6 mm (for example DN6 or ZHOP) with 500 mm span.

Sheathing is carried out using two layers of Glasroc F boards Ridurit with 20 mm thickness, the boards are oriented horizontally. First sheathing layer is fixed with TN 212 screws in spacing 200mm to the support structure. The boards are mounted to tight butt joints without need of cementing. The second sheathing layer is screwed to the first sheathing layer using screws Rodurit in square net 250 mm. Reset of joints of the first and second layer of Ridurit sheathing is set to 600 mm vertically and 300 mm horizontally.

Assembly with support structure

Vertical intermediate R-CW sections are fixed in 1000 mm layout spacing between R-UW sections and vertical perimeter R-CW sections.

Assembly without support structure

Maximum width of the shaft wall is 2 metres in this case (board length). Steel squares made from steel galvanized plate metal 40/20/1 mm are used as perimeter sections, they are anchored to bearing wall using Ø 6 mm steel plugs (for example DN6 or ZHOP) with 500 mm spacing.

Fig. 68

Fig. 69 Thin shaft wall - mortar or gypsum

EIS 90

Position:

- 1 Fire damper
- 2 Mortar or gypsum
- 3 Fire resistant board
- 4 Profil 50 UW or 50 CW
- 5 Screw
- 6 Additional fire resistant board

Used materials - example:*

- 3 Glasroc F Ridurit th. 20 mm
- 4 R-CW
- 5 Screw Ridurit
- 6 Glasroc F Ridurit th. 20 mm

* It is alternatively possible to use Knauf or Promat solution.

Shown schemes of incorporation and damper are illustrative only !

Fig. 70 Thin shaft wall - installation frame E1

**Position:**

- 1 Fire damper
- 2 Installation frame E1
- 3 Holder (including in installation frame E1 packing)
- 4 Fire resistant board
- 5 Screw
- 6 Additional fire resistant board
- 7 Fire resistant foam tape

Used materials - example:*

- 4 Glasroc F Ridurit th. 20 mm
- 5 Screw Ridurit
- 6 Glasroc F Ridurit th. 20 mm
- 7 Promaseal XT

* It is alternatively possible to use Knauf or Promat solution.

Notice: Gap between frame and thin shaft wall construction must be filled by glue (PROMAT K84).
 Dampers has to be suspended in an appropriate manner see chapter 9.

Shown schemes of incorporation and damper are illustrative only !

Fig. 71

Installation frame E1

Installation frame E2

Installation frame E3

Installation frame E4

Installation frame E5

Installation frame E6

Installation frame can be delivered mounted on the damper body or separately.

Installation frame E1

Installation frame E1 is suitable for:

- Solid wall construction
- Gypsum wall construction
- Solid ceiling construction

On the inside and outside is installation frame equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between damper body and installation frame and between installation frame and wall construction.

Installation:

- Gypsum wall construction has to be installed according manufacture requirements.

Material:

- Installation frame: cement lime plates
- Fasteners: galvanized plate

Installation opening:

- $a \times b = (A + 105^{+3} \text{mm}) \times (B + 105^{+3} \text{mm})$

Fig. 72 Installation frame E1

Installation frame E2

Installation frame E2 is suitable for:

- Solid wall construction
- Solid ceiling construction

Damper is on the body equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between damper body and steel cartridge.

Installation:

- Gypsum wall construction has to be installed according manufacture requirements.

Material:

- Installation frame: cement lime plates and galvanized plate
- Fasteners: galvanized plate

Installation opening:

- $a \times b = (A + 100^{+3}mm) \times (B + 100^{+3}mm)$

Fig. 73 Installation frame E2

Installation frame E3

Installation frame E3 is suitable for:

- Gypsum wall construction

Damper is on the body equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between damper body and cement lime cartridge.

On the outside is cement lime cartridge equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between cement lime cartridge and construction.

Installation:

- Gypsum wall construction has to be installed according manufacture requirements.

Material:

- Installation frame: cement lime plates
- Fasteners: galvanized plate

Installation opening:

- $a \times b = (A + 103^{+3}\text{mm}) \times (B + 103^{+3}\text{mm})$

Fig. 74 Installation frame E3

Gypsum wall construction

Position:

- 1 Fire damper
- 2 Installation frame E3
- 3 Holder with screws
- 4 Stuffing box (mineral stone wool min. density 140 kg/m^3)
- 5 Fire protection mastic min. thickness 1 mm

Notice: Gap between frame and thin shaft wall construction must be filled by glue (PROMAT K84).
Dampers has to be suspended in an appropriate manner see chapter 9.

Shown schemes of incorporation and damper are illustrative only !

Dimensions	Number ZB1	Number ZH1
$A, B \leq 400$	1	1
$400 < A, B \leq 800$	2	2
$800 < A \leq 1200$	3	3
$1200 < A \leq 1500$	4	4

Installation frame E4

Installation frame E4 is suitable for:

- Instalaci on solid wall/ceiling construction
- Installation on gypsum wall construction
- Instalaci outside solid ceiling constructions with concrete

On the inside is installation frame equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between installation frame and damper body.

Installation:

- Gypsum wall construction has to be installed according manufacture requirements.

Material:

- Installation frame: cement lime plates
- Fasteners: galvanized plate

Installation opening:

- $a \times b = (A + 5^{+3}\text{mm}) \times (B + 5^{+3}\text{mm})$
- $a \times b = (A + 100^{+3}\text{mm}) \times (B + 100^{+3}\text{mm})$ installation with concrete

Fig. 75 Installation frame E4

Installation frame E5

Installation frame E5 is suitable for gypsum wall construction with ceiling movement possibility. Distance of movement "x".

On the inside and outside is installation frame equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between damper body and installation frame and between installation frame and wall construction.

Installation:

Damper position:

- Directly on the ceiling
- In distance from ceiling max. 80 mm

Material:

- Installation frame: cement lime plates
- Fasteners: galvanized plate

Notice:

- For ceiling movement ≥ 10 mm

Fig. 76 Installation frame E5

Gypsum wall construction with flexible ceiling (with possibility to move/to sag)

Notice: Fitting with threaded rods or steel bracket

Shown schemes of incorporation and damper are illustrative only !

Installation frame E6

Installation frame E6 is suitable for:

- Installation outside solid wall/ceiling construction with cement lime plates
- On the inside is installation frame equipped by intumescent sealing. It enlarges its capacity and air proofs the gap between installation frame and damper body.

Material:

- Installation frame: cement lime plates
- Fasteners: galvanized plate

Installation opening:

- $a \times b = (A + 105^{+3}\text{mm}) \times (B + 105^{+3}\text{mm})$

Fig. 77 Installation frame E6

VRM reinforcing frame

For dampers with $A \geq 800$ and damper placement outside wall construction is necessary to use reinforcement VRM.

Fig. 78 Fixing of reinforcement to damper body VRM

Important: For lower fire resistance than EI90 the reinforcement VRM is not necessary !!!

- 1.) Insert part A into reinforcement VRM
- 2.) Set up nut of the part A under correct hole
- 3.) Lock screw B
- 4.) It has to be done on each side of VRM

Shown dampers are illustrative only !

Fig. 79 Installation procedure

Installation details see chapter 9.4.

Shown schemes of incorporation and damper are illustrative only !

9. Suspension system

9.1. Mounting to the ceiling wall

Fig. 80 Mounting to the ceiling wall

Hinge plates

Load capacities of threaded hanger rods F [N] at the required fire resistance 90 minutes

Size	A _s [mm ²]	Weight G [kg]	
		for 1 piece	for 1 pair
M8	366	22	44
M10	58	35	70
M12	84,3	52	104
M14	115	70	140
M16	157	96	192
M18	192	117	234
M20	245	150	300

- Position:
- 1 Threaded rod M8 – M20
 - 2 Nut
 - 3 Washer
 - 4 Coupling Nut
 - 5 Anchor
 - 6 Hinge plate - min. thickness 10 mm

9.2. Horizontal installation

Fire dampers can be suspended by using threaded rods and a mounting profiles. Load the suspension system depend on weight of the fire damper.

Damper assembly procedures must be done so as all load transfer from the fire separating constructions to the damper body is absolutely excluded. Back-to-back air-conditioning piping must be hung or supported so as all load transfer from the back-to-back piping to the damper is absolutely excluded.

Threaded rods longer than 1,5 m require fire-resistant insulation.

Threaded rod fixing to the ceiling construction.

Fig. 81 Suspension - horizontal duct

Position:

- 1 Fire damper
- 2 Damping pad
- 3 Extension piece
- 4 Threaded rod
- 5 Mounting rail
- 6 Nut
- 7 U - Washer
- 8 Washer

Examples of using materials: HILTI, SIKLA, MÜPRO etc.

Shown schemes of incorporation and damper are illustrative only !

9.3. Vertical installation

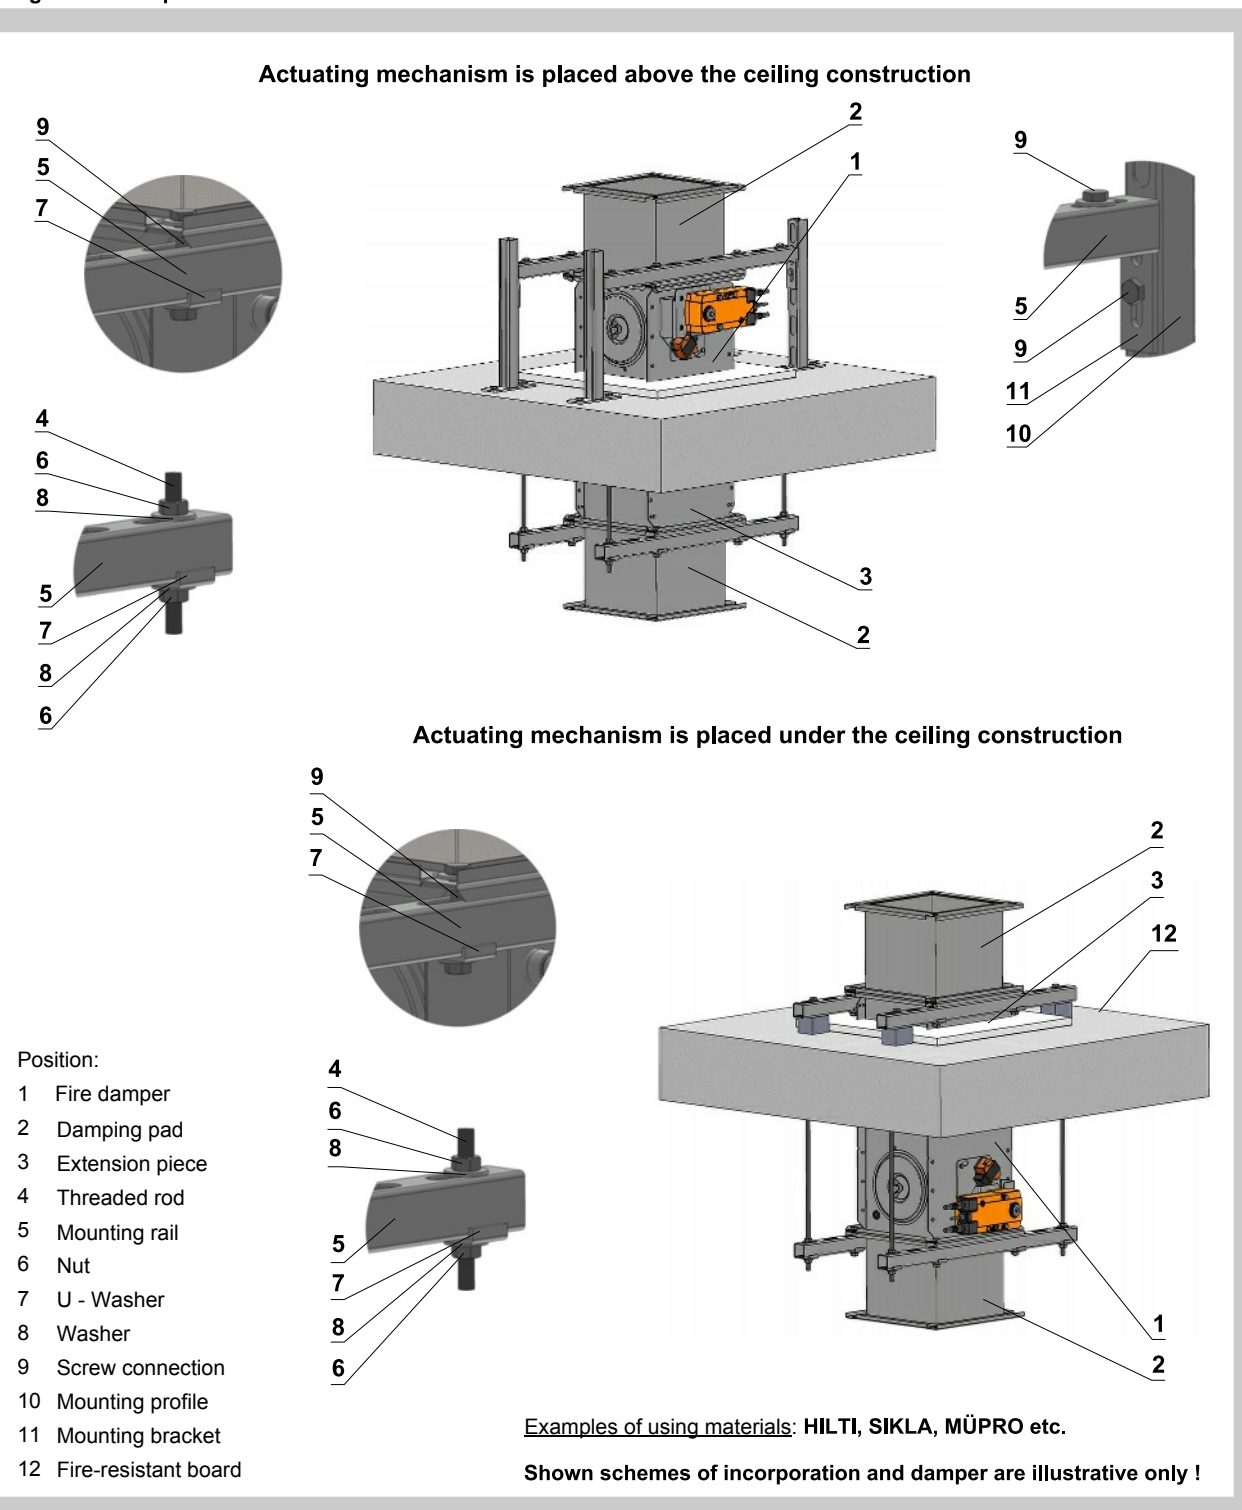

Fire dampers can be suspended by using threaded rods and a mounting profiles. Load the suspension system depend on weight of the fire damper.

Damper can be suspended from the ceiling construction or supported above the ceiling construction.

Damper assembly procedures must be done so as all load transfer from the fire separating constructions to the damper body is absolutely excluded. Back-to-back air-conditioning piping must be hung or supported so as all load transfer from the back-to-back piping to the damper is absolutely excluded.

Threaded rods longer than 1,5 m require fire-resistant insulation.

Fig. 82 Suspension - vertical duct

9.4. Rectangular fire damper suspension on the wall - horizontal installation

Duct between fire damper and fire separating construction can be suspended by using threaded rods and mounting profiles. Load the suspension system depend on weight of the fire damper and duct system.

Max. length between two suspension systems is 1500 mm.

Damper assembly procedures must be done so as all load transfer from the fire separating constructions to the damper body is absolutely excluded. Back-to-back air-conditioning piping must be hung or supported so as all load transfer from the back-to-back piping to the damper is absolutely excluded.

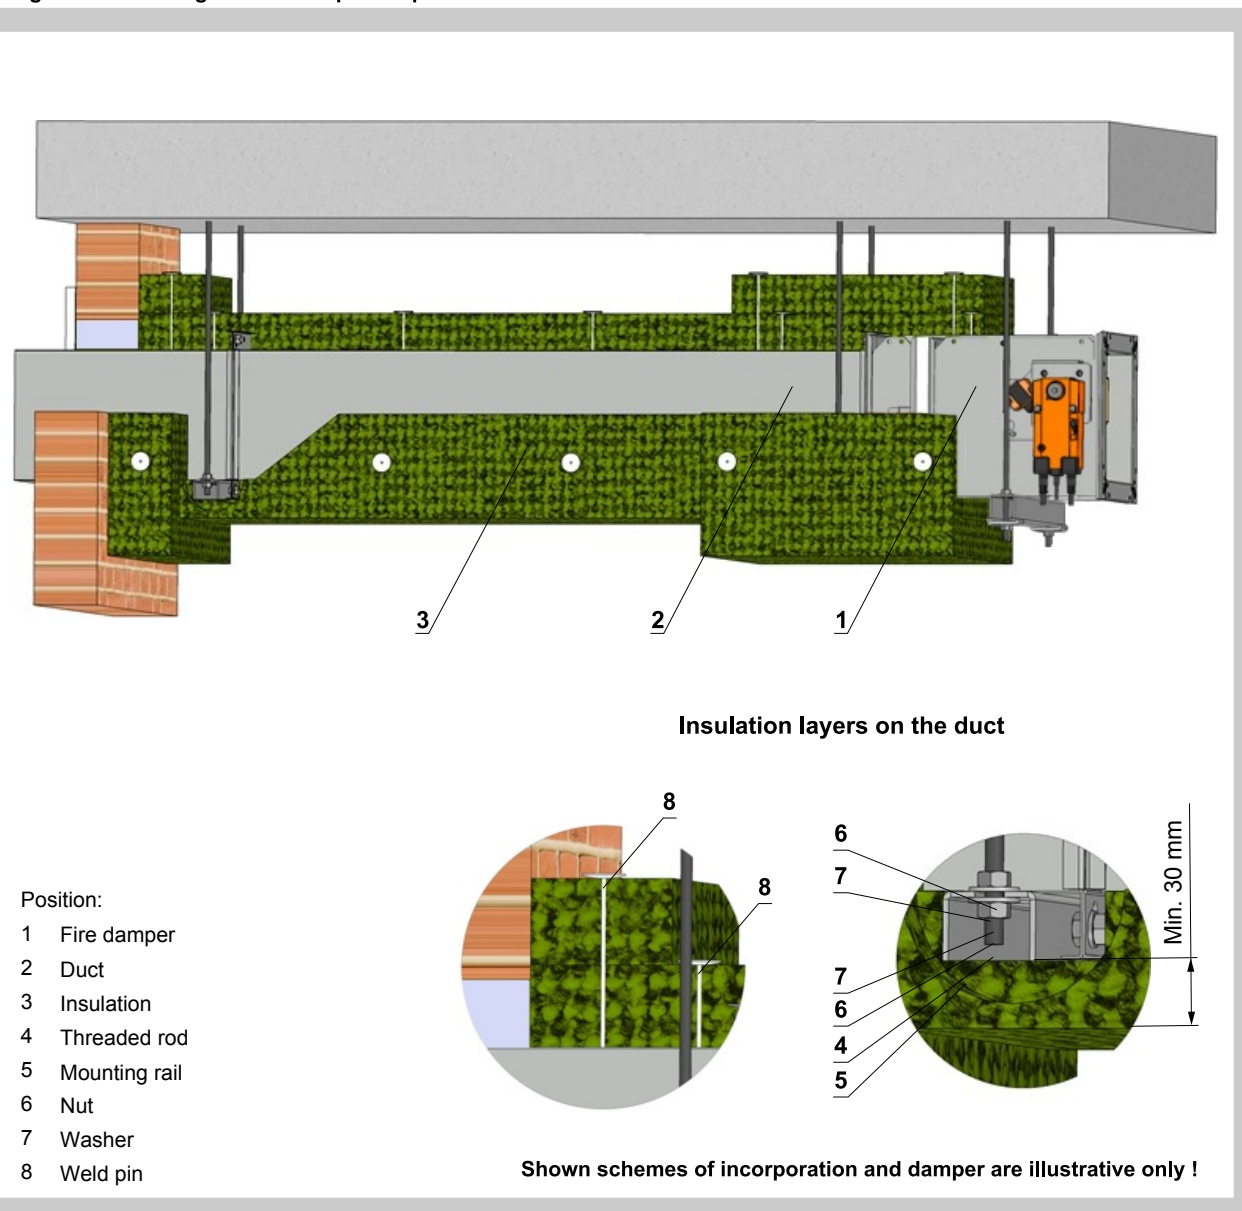

Threaded rods longer than 1,5 m require fire-resistant insulation.

If the threaded rod is located inside the duct insulation, distance between threaded rod and duct is max 30 mm. If the threaded rod is located outside the duct insulation, distance between threaded rod and isolation is max. 40 mm. Thickness of the insulation under mounting profile must be min. 30 mm.

Threaded rod fixing to the ceiling construction - see fig. 80

The insulation boards are fastened to the duct by weld pins. Distance between weld pins, distance between weld pins and flanges is dependent on the materials. For more information see documentation of insulation manufacturer.

Fig. 83 Rectangular fire damper suspension on the wall - horizontal installation

III. TECHNICAL DATA

10. Pressure loss

10.1. Pressure loss calculation

$$\Delta p = \xi \cdot \rho \cdot \frac{w^2}{2}$$

Δp	[Pa]	pressure loss
w	[m.s ⁻¹]	air flow speed in nominal damper section
ρ	[kg.m ³]	air density
ξ	[-]	coefficient of local pressure loss for the nominal damper section (see Tab. 11.1.1.)

10.2. Determination of pressure loss by using diagram $\rho = 1,2 \text{ kg.m}^3$

Diagram 10.2.1. Pressure losses for air density $\rho = 1,2 \text{ kg.m}^3$

12. Noise data

12.1. Level of acoustic output corrected with filter A.

$$L_{WA} = L_{W1} + 10 \log(S) + K_A$$

L_{WA} [dB(A)] level of acoustic output corrected with filter A.

L_{W1} [dB] level of acoustic output L_{W1} related to the 1 m² section (see Tab. 12.3.1.)

S [m²] duct cross section

K_A [dB] correction to the weight filter A (see Tab. 12.3.2.)

12.2. Level of acoustic output in octave ranges.

$$L_{Woct} = L_{W1} + 10 \log(S) + L_{rel}$$

L_{Woct} [dB] spectrum of acoustic output in octave range

L_{W1} [dB] level of acoustic output L_{W1} related to the 1 m² section (see Tab. 12.3.1.)

S [m²] duct cross section

L_{rel} [dB] relative level expressing the shape of the spectrum (see Tab. 12.3.3.)

12.3. Table of acoustics values

Tab. 12.3.1. Level of acoustic output L_{W1} [dB] related to the 1 m² section

IV. MATERIAL, FINISHING

13. Material

- 13.1.** Damper bodies are supplied in the design made of galvanized plate without any other surface finishing.

Damper blades are made of fire resistant asbestos free boards made of mineral fibres.

Control devices of dampers has cover from mechanically resistant and standing plastic and rest of the parts is galvanised without further surface treatment.

Springs are galvanized.

Thermal protective fuses are made of sheet brass, thickness = 0.5 mm.

Fasteners is galvanized. Fasteners is galvanized.

- 13.2.** According to the customer's requirements, damper can be made of stainless material.

Specifications for stainless-steel models – classification of stainless steel:

- Class A2 – Food-grade stainless steel (AISI 304 – ČSN 17240)
- Class A4 – Chemistry-grade stainless steel (AISI 316, 316L – ČSN 17346, 17349)

The respective stainless steel is the material for all components present or accessing the damper interior; components outside the damper body are typically from galvanised sheet metal (fasteners for mounting the servo drive or mechanics, mechanics components except Item 4), frame components.

The following components, including the fasteners, are made from stainless steel at all times:

- 1) Damper body and all components permanently attached
- 2) Leaf holders, including pins, metal parts of leaf
- 3) Control components inside the damper (leaf angle selector, pin with lever)
- 4) Mechanical components entering the interior of damper body (lower sheet of mechanics, lock holder "1", lock lever "2", lock spring, 8 dia. stopper pin, mechanics pin)
- 5) Inspection hole cover including the clip and fasteners (if they are parts of the cover)
- 6) Bearing for torque transfer from the lever with pin on the angle selector at the leaf (made from AISI 440C)

The leaf of the damper is made from a single piece of homogeneous material Promatect-MST, thickness 40 mm.

Plastic, rubber and silicon components, sealants, foaming bands, glass-ceramic seals, housings, brass bearings of the leaf, servo drives, and end switches are identical for all material variants of the dampers.

The thermal link is identical for all material variants of the dampers. Upon specification by customer, the thermal link may be made from A4 stainless steel. The solder is standard, corresponding to the initialisation temperature.

The temperature-dependent initiator of the servo drive (sensor) is modified for stainless-steel variants of the dampers; the standard galvanised screws are replaced with stainless-steel M4 screws of corresponding class the counterpart has stainless-steel riveting M4 nuts.

Some fasteners and components are available in one class of stainless steel; the type will be used in all stainless-steel variants.

The leaf in the variants for chemical environments (Class A4) is always treated with a coating of chemically resistant Promat SR.

Any other requirements for the design shall be considered atypical and shall be addressed on an individual basis.

V. INSPECTION, TESTING

14. Inspection

- 14.1.** Sizes are checked by common measuring instruments according to the standard of non-tolerated sizes, used in air conditioning industry.

Interoperational checks of components and main sizes are carried out according to drawing documentation.

15. Testing

- 15.1.** After workshop installation, a 100% check of function of closing mechanism and electric components is carried out.

VI. TRANSPORTATION AND STORAGE

16. Logistic terms

- 16.1.** The dampers are delivered as bulk cargo. Any other packing methods must be agreed with the manufacturer in advance. The potential packages will be considered non-returnable and their price will not be included in the product price.

The dampers are transported by box freight vehicles; no sharp shocks must occur and the ambient temperature must not exceed +40°C. For handling during transport, the dampers must be protected against mechanical damages and weather impact. If the customer wishes it, the dampers can be transported on pallets. During transport, the damper blade must be in the "CLOSED" position.

Unless another method of reception is specified in the purchase order, the handover of the dampers to the forwarder shall be understood as reception.

- 16.2.** The dampers must be stored in covered buildings, in an environment without aggressive vapours, gases and dust. A temperature in a range of -5°C and +40°C and a relative humidity of max. 80% must be maintained in the buildings.
For handling during storage, the dampers must be protected against mechanical damage.

- 16.3.** The delivery includes the complete damper and the delivery note.

17. Warranty

- 17.1.** The manufacturer provides a warranty of 24 months from the date of dispatch for the dampers.

The warranty for fire dampers FDMQ, provided by the manufacturer, shall become completely null and void if the starting, closing and control devices are unprofessionally handled by untrained workers or if electric components, i.e. limit switches, actuating mechanisms, communication and supply devices and thermoelectric starting mechanisms are dismantled. The warranty shall also become null and void if the dampers are used for other purposes, devices and working conditions than those allowed by these technical conditions or if the dampers are mechanically damaged during handling.

- 17.2.** If the dampers are damaged by transport, a record must be written down with the forwarder at reception for later complaint.

VII. ASSEMBLY, ATTENDANCE, MAINTENANCE AND REVISIONS**18. Assembly**

- 18.1.** The assembly of the dampers must be carried out while observing all applicable safety standards and regulations.
- 18.2.** The damper body should not be deformed in the course of bricking in. Once the damper is built in, its blade should not grind on the damper body during opening or closing.

Fig. 84 Embedding / fixing the damper

Protecting the damper against buckling, above all when there are big diameters and sizes of fire dampers!

WRONG!

Brace with wooden blocks

- 18.3.** All flange and screw joints must be conductively connected during the assembly to provide protection against dangerous contact. 2 fan-shaped washers in galvanized version are to be used for conductive connection; they are to be situated under the head of one bolt and under the screwed nut.
- 18.4.** If the damper is equipped with limit switches and the said devices are not used during operation (e.g. because of a project change), they can be left on the damper and not connected (they need not be dismounted). On the other hand, if a limit switch is to be added to the damper design, the change can be implemented by adding the required device to the base plate of the damper. The said facts must be recorded in the respective operation documentation of the damper (record books of the damper, fire logs, etc.) and subsequently, adequate function checks must be carried out.
- 18.5.** For a reliable function of the dampers, their closing mechanism and the seating faces of the blade must be protected from dust, fibrous or adhesive masses and solvents.
- 18.6.** Control of actuating mechanism without electric voltage:

You can set the damper blade in any position with the help of a special wrench (included in the delivery of the actuating mechanism). By turning the wrench in the direction of the arrow, the damper blade will move to the open position. By stopping the damper blade in any position, the actuating mechanism will be locked according to the instructions on the actuating mechanism. The mechanism can be unlocked manually according to the instructions on the mechanism or by means of supply voltage.

WARNING!

If the actuating mechanism is manually locked, the damper blade will not close in case of fire after activation of the thermoelectric starting mechanism BAT. To restore the correct function of the damper, the actuating mechanism must be unlocked (manually or by means of supply voltage).

19. Entry into service and revisions

- 19.1.** Before entering the dampers into operation after their assembly and by sequential checks, the following checks must be carried out. Visual inspection of proper damper integration, inside damper area, damper blade, contact surfaces and silicon sealing. Check of thermal protective fuse and closing mechanism. Check the closing function of the damper blade. This can be done by removing of thermal fuse from damper body.

Before entering the dampers with actuating mechanism into operation after their assembly and by sequential checks. Check of blade displacement into the breakdown position "CLOSED" can be done after cutting off the actuating mechanism supply (e.g. by pressing the RESET button at the thermoelectrical starting mechanism BAT or cutting off the supply from ELECTRICAL FIRE SIGNALISATION). Check of blade displacement back into the "OPEN" position can be done after restoration of power supply (e.g. by releasing the RESET button or restoration of supply from ELECTRICAL FIRE SIGNALISATION). Without power supply, the damper can be operated manually and fixed in any required position. Release of the locking mechanism can be achieved manually or automatically by applying the supply voltage. It is recommended to provide periodical checks, maintenance and service actions on Fire Equipment by Authorized persons. The authorized persons can be trained by Producer, or by authorized Distributor. All effective safety standards and directives must be observed during fire damper assembly.

For regular or exceptional inspection of interior of fire damper, micro-camera device can be used. On each fire damper is inspection hole. In the case of inspection by camera, take out the black rubber cap, insert the camera inside the damper, check interior and at the end of inspection, put the rubber cap back tightly to cover the empty hole.

- 19.2.** Before entering the dampers with manual control (design .01, .11, .80) into operation after their assembly and by sequential checks and following checks must be carried out.

Verification of closing device and thermal fuse:

When you verify functionality of mechanism, follow these steps:

Adjustment of damper blade in position "CLOSED" shall be made following:

- Damper is in „OPEN“ position.
- By pressing control button mechanism, you close damper in "CLOSED" position.
- Check damper blade adjustment in "CLOSED" position.
- Closing must be strong and control lever must be in "CLOSED" position.
- If closing is not sufficiently strong and damper control lever is not in "CLOSED" position, you must contact manufacturer and order new mechanism.
- Mechanism dimension is marked M1 to M5, according to internal forces of spring.

Adjustment of damper blade in position "OPEN" shall be made following:

- Rotate control lever by 90°.
- Lever get fasten automatically in "OPEN" position.
- Check damper blade adjustment in "OPEN" position.

Checking function and the status of the thermal fuse shall be made following:

- To check the function and the status of the fuse is possible to remove whole mechanism from the body of fire damper - mechanism is attached to the dampers body with four screws M6.
- Removing the thermal fuse from the fuse holder of initiation device, check its correct functionality.
- There must be a release lever, which releases initiation lever of control and mechanism will displace to "CLOSED" position.
- If not, you need to contact the manufacturer and order new mechanism.
- Mechanism dimension is marked M1 to M5, according to internal forces of spring.

19.3. For the designs with actuating mechanisms, the following checks must be carried out:

Check the shift of the blade to "CLOSED" failure position after cutting off the power supply to the actuating mechanism (e.g. by pressing the reset button on the thermoelectric starting mechanism BAT, by cutting off the power supply from electrical fire signalization). Check the shift of the blade back to "OPEN" position by restoring the power supply to the actuating mechanism (e.g. by releasing the reset button, by restoring the power supply from electrical fire signalization).

19.4. The check of function of the damper with actuating mechanism can be carried out as follows:

- a) by cutting off and restoring the power supply, e.g. by a signal from electrical fire signalization
- b) directly on the installed damper, with the help of the button on the thermoelectric starting mechanism BAT (simulating fuse tripping).

19.5. Before putting the dampers into operation and during subsequent function checks, the following checks must be carried out for dampers with optical smoke detector.

The function checks of the optical smoke detector are to be carried out by employees of an authorized organization who have corresponding electrotechnical qualification and have been provably trained by the manufacturer. The function checks are to be carried out as a part of function checks of the fire dampers, at least 1x a year.

19.6. For the function checks, the dampers should be moved to "CLOSED" position with the fan off or with closed regulation valve situated between the fan and the fire damper.

20. Spare parts

20.1. Spare parts are supplied only on basis of an order.

20.2. Control for square damper and round damper is identical.

21. Restore function of actuating mechanism after fuses initiation

21.1. If fuse Tf1 is initiated (duct outside temperature) than is necessary to change thermoelectrical starting mechanism BAT72B-S. Whereas is initiation temperature higher than actuator mechanism operating temperature +50°C, recommended actuating mechanism manufacturer make complete revision or change actuating mechanism and thermoelectrical starting mechanism.

21.2. If fuses Tf2/Tf3 are initiated (duct inside temperature) than is possible change only part ZBAT72 or ZBAT95 (according initiating temperature).

VIII. ORDERING INFORMATION

22. Ordering key

22.1. Fire damper

If installation frame or design for installation in Weichschott system are requested, it has to be mentioned separately in the order. Installation frame could be fixed to the damper body or supplied separately.

Tab. 22.1.1. Dampers design

Dampers design	Additional digit
Manual and thermal	.01
Manual and thermal (Zone 1,2)	.02
Manual and thermal with a terminal switch („CLOSED“)	.11
Manual and thermal with a terminal switch („CLOSED“) (Zone 1,2)	.12
With actuating mechanism BF 230-TN (BFL, BFN 230-T) - voltage AC 230 V	.40
With actuating mechanism BF 24-TN (BFL, BFN 24-T), with smoke detector ORS 142 K and with supply device BKN 230-24-MOD (voltage AC 230 V)	.41
With actuating mechanism ExMax-15-BF (AC 230 V, AC/DC 24 V) with thermoelectric activation mechanism (Zone 1,2)	.42
With actuating mechanism BF 24-TN (BFL, BFN 24-T) - voltage AC/DC 24 V	.50
With actuating mechanism BF 24-TN (BFL, BFN 24-T), with smoke detector ORS 142 K (voltage AC/DC 24 V)	.51
With communication and supply device BKN 230-24 and actuating mechanism BF 24-TN-ST (BFL, BFN 24-T-ST)	.60
With communication and supply device BKN 230-24-C-MP, with actuating mechanism BF 24-TN-ST (BFL, BFN 24-T-ST) and with smoke detector ORS 142 K	.61
With communication and supply device BKN 230-24MP and with actuating mechanism BF 24TL-TN-ST (Top-Line) for connection to MP-Bus	.62
With communication and supply device BKN 230-24-MOD, with actuating mechanism BF 24-TN-ST (BFL, BFN 24-T-ST) and with smoke detector ORS 142 K	.63
With communication and supply device BKN 230-24LON and with actuating mechanism BF 24TL-TN-ST (Top-Line) for connection to LonWorks	.64
Manual and thermal with two terminal switches („OPEN“, „CLOSED“)	.80
Manual and thermal with two terminal switches („OPEN“, „CLOSED“) (Zone 1,2)	.81

22.2. Reinforcement - damper placement outside wall or ceiling construction

IX. PRODUCT DATA

23. Data label

23.1. Data label is placed on the damper body.
